circular rectangular transition ducts are used between engine exhausts and nozzles with rectangular cross sections that are designed for high performance aircraft nasa glenn research center has made experimental investigations of a series of circular rectangular transition ducts to provide benchmark flow data for comparison with numerical calculations these ducts are all designed with superellipse cross sections to facilitate grid generation in response to this challenge the three dimensional rns3d code has been applied to one of these transition ducts this particular duct has a length to inlet diameter ratio of 1 5 and an exit

plane aspect ratio of 3 0 the inlet mach number is 0 35 two grc experiments and the code were run for this duct without inlet swirl one grc experiment and the code were also run with inlet swirl with no inlet swirl the code was successful in predicting pressures and secondary flow conditions including a pair of counter rotating vortices at both sidewalls of the exit plane all these phenomena have been reported from the two grc experiments however these vortices were suppressed in the one experiment when inlet swirl was used whereas the rns3d code still predicted them the experiment was unable to provide data near the sidewalls the very region where the vortices were predicted
